

BGP Scaling Techniques

- How to scale iBGP mesh beyond a few peers?
- How to implement new policy without causing flaps and route churning?
- How to reduce the overhead on the routers?

BGP Scaling Techniques

- Soft reconfiguration/Route Refresh
- Peer groups
- Route flap dampening
- Route reflectors
- (Confederations)

Dynamic Reconfiguration

Soft Reconfiguration and Route Refresh

Soft Reconfiguration

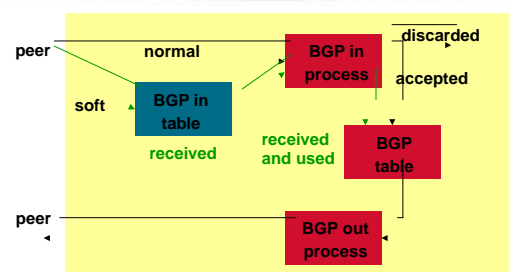

Problem:

- Hard BGP peer clear required after every policy change because the router does not store prefixes that are denied by a filter
- Hard BGP peer clearing consumes CPU and affects connectivity for all networks

Solution:

- **Soft-reconfiguration**

Soft Reconfiguration

Soft Reconfiguration

- New policy is activated without tearing down and restarting the peering session
- Per-neighbour basis
- Use more memory to keep prefixes whose attributes have been changed or have not been accepted

SD-WAN Workshop © 2006 Cisco Systems, Inc. www.cisco.com

Configuring Soft reconfiguration

```
router bgp 100
neighbor 1.1.1.1 remote-as 101
neighbor 1.1.1.1 route-map infilter in
neighbor 1.1.1.1 soft-reconfiguration inbound
! Outbound does not need to be configured !
Then when we change the policy, we issue an exec
command
clear ip bgp 1.1.1.1 soft [in | out]
```

SD-WAN Workshop © 2006 Cisco Systems, Inc. www.cisco.com

Managing Policy Changes

- `clear ip bgp <addr> [soft] [in|out]`
 <addr> may be any of the following
- | | |
|-------------------|---------------------------|
| x.x.x.x | IP address of a peer |
| * | all peers |
| ASN | all peers in an AS |
| external | all external peers |
| peer-group <name> | all peers in a peer-group |

SD-WAN Workshop © 2006 Cisco Systems, Inc. www.cisco.com

Route Refresh Capability

- Facilitates non-disruptive policy changes
- No configuration is needed
- No additional memory is used
- Requires peering routers to support “route refresh capability” - RFC2842
- **clear ip bgp x.x.x.x in** tells peer to resend full BGP announcement

SD-WAN Workshop © 2006 Cisco Systems, Inc. www.cisco.com

Soft Reconfiguration vs Route Refresh

- Use Route Refresh capability if supported
 find out from “show ip bgp neighbor”
 uses much less memory
- Otherwise use Soft Reconfiguration

SD-WAN Workshop © 2006 Cisco Systems, Inc. www.cisco.com

Peer Groups

SD-WAN Workshop © 2006 Cisco Systems, Inc. www.cisco.com

Peer Groups

Without peer groups

- iBGP neighbours receive same update
- Large iBGP mesh slow to build
- Router CPU wasted on repeat calculations

Solution - peer groups!

- Group peers with same outbound policy
- Updates are generated once per group

Peer Groups - Advantages

- Makes configuration easier
- Makes configuration less prone to error
- Makes configuration more readable
- Lower router CPU load
- iBGP mesh builds more quickly
- Members can have different inbound policy
- Can be used for eBGP neighbours too!

Configuring Peer Group

```
router bgp 100
neighbor ibgp-peer peer-group
neighbor ibgp-peer remote-as 100
neighbor ibgp-peer update-source loopback 0
neighbor ibgp-peer send-community
neighbor ibgp-peer route-map outfilter out
neighbor 1.1.1.1 peer-group ibgp-peer
neighbor 2.2.2.2 peer-group ibgp-peer
neighbor 2.2.2.2 route-map infilter in
neighbor 3.3.3.3 peer-group ibgp-peer
```

! note how 2.2.2.2 has different inbound filter from peer-group !

Configuring Peer Group

```
router bgp 109
neighbor external-peer peer-group
neighbor external-peer send-community
neighbor external-peer route-map set-metric out
neighbor 160.89.1.2 remote-as 200
neighbor 160.89.1.2 peer-group external-peer
neighbor 160.89.1.4 remote-as 300
neighbor 160.89.1.4 peer-group external-peer
neighbor 160.89.1.6 remote-as 400
neighbor 160.89.1.6 peer-group external-peer
neighbor 160.89.1.6 filter-list infilter in
```

Route Flap Dampening

Stabilising the Network

Route Flap Dampening

- Route flap
 - Going up and down of path
 - Change in attribute
 - Ripples through the entire Internet
 - Wastes CPU
- Dampening aims to reduce scope of route flap propagation

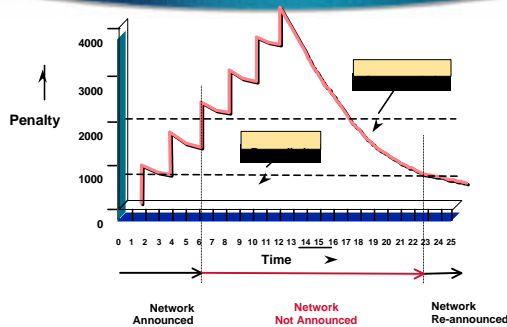

Route Flap Dampening (Continued)

- **Requirements**
 - Fast convergence for normal route changes
 - History predicts future behaviour
 - Suppress oscillating routes
 - Advertise stable routes
- Described in RFC2439

Route Flap Dampening - Operation

- Add penalty (1000) for each flap
- Exponentially decay penalty
 - half life determines decay rate
- Penalty above suppress-limit
 - do not advertise route to BGP peers
- Penalty decayed below reuse-limit
 - re-advertise route to BGP peers

Route Flap Dampening

Route Flap Dampening - Operation

- Only applied to inbound announcements from eBGP peers
- Alternate paths still usable
- Controlled by:
 - Half-life (default 15 minutes)
 - reuse-limit (default 750)
 - suppress-limit (default 2000)
 - maximum suppress time (default 30 minutes)

Flap Dampening: Enhancements

- **Selective dampening based on**
 - AS-path, Community, Prefix
- **Variable dampening**
 - recommendations for ISPs
 - <http://www.ripe.net/docs/ripe-210.html>
- **Flap statistics**

```
show ip bgp neighbor <x.x.x.x> [dampened-routes | flap-statistics]
```

Configuring Route Flap Dampening

Fixed dampening

```
router bgp 100
  bgp dampening [<half-life> <reuse-value> <suppress-penalty> <maximum suppress time>]
```

Selective and variable dampening

```
bgp dampening [route-map <name>]
route-map <name> permit 10
  match ip address prefix-list FLAP-LIST
  set dampening [<half-life> <reuse-value> <suppress-penalty> <maximum suppress time>]
ip prefix-list FLAP-LIST permit 192.0.2.0/24 le 32
```

Route Reflectors

Scaling iBGP mesh

- Need to avoid routing information loop
- Solution should not change the current behaviour
- Two solutions
 - Route reflector - simpler to deploy and run
 - Confederation - more complex to manage, corner case benefits

Route Reflector: Principle

Route Reflector

- Reflector receives path from clients and non-clients
- Selects best path
- If best path is from client, reflect to other clients and non-clients
- If best path is from non-client, reflect to clients only
- Non-meshed clients
- Described in RFC2796

Route Reflector Topology

- Divide the backbone into multiple clusters
- At least one route reflector and few clients per cluster
- Route reflectors are fully meshed
- Clients in a cluster could be fully meshed
- Single IGP to carry next hop and local routes

Route Reflectors: Loop Avoidance

- Originator_ID attribute
 - Carries the RID of the originator of the route in the local AS (created by the RR)
 - Cluster_list attribute
 - The local cluster-id is added when the update is sent to (added by the RR)
- bgp cluster-id x.x.x.x**

Route Reflector: Benefits

- Solves iBGP mesh problem
- Packet forwarding is not affected
- Normal BGP speakers co-exist
- Multiple reflectors for redundancy
- Easy migration
- Multiple levels of route reflectors

© 2006 Cisco Systems, Inc. www.cisco.com

31

Route Reflectors: Migration

- Where to place the route reflectors?
Follow the physical topology!
This will guarantee that the packet forwarding won't be affected
- Configure one RR at a time
Eliminate redundant iBGP sessions
Place one RR per cluster

© 2006 Cisco Systems, Inc. www.cisco.com

32

Route Reflector: Migration

- Migrate small parts of the network, one part at a time.

© 2006 Cisco Systems, Inc. www.cisco.com

33

Configuring a Route Reflector

```
router bgp 100
neighbor 1.1.1.1 remote-as 100
neighbor 1.1.1.1 route-reflector-client
neighbor 2.2.2.2 remote-as 100
neighbor 2.2.2.2 route-reflector-client
neighbor 3.3.3.3 remote-as 100
neighbor 3.3.3.3 route-reflector-client
```

34

BGP Scaling Techniques

- These 4 techniques should be core requirements on all ISP networks
 - Soft reconfiguration/Route Refresh
 - Peer groups
 - Route flap dampening
 - Route reflectors

© 2006 Cisco Systems, Inc. www.cisco.com

35

BGP Confederations

© 2006 Cisco Systems, Inc. www.cisco.com

36

Confederations

Confederations: Principle

- Best path sent to neighbour sub-AS
- Packet forwarding depends on next hop
- IGP carries next hops and local networks
- Preserve next hop across sub-AS eBGP

Confederations: Next Hop

Confederation: Principle

- Local preference and MED influence path selection
- Preserve local preference and MED across sub-AS boundary
- Sub-AS eBGP path administrative distance

Confederations: Loop Avoidance

- Sub-AS traversed are carried as part of AS-path
- AS-sequence and AS path length
- Confederation boundary
- AS-sequence should be skipped during MED comparison

Confederations: AS-Sequence

Confederations: Benefits

- Solves iBGP mesh problem
- Packet forwarding not affected
- Can be used with route reflectors
- Policies could be applied to route traffic between sub-AS's

© 2000 Cisco Systems, Inc. www.cisco.com

43

Confederations: Caveats

- Minimal number of sub-AS
- Sub-AS hierarchy
- Minimal inter-connectivity between sub-AS's
- Path diversity
- Difficult migration
 - BGP reconfigured into sub-AS
 - must be applied across the network
